

Sky Receiver Remote Eye Kit

The AQUAVISION® Remote Eye Kit is the easiest solution to control Sky Digital broadcasts on your AQUAVISION® LCD.

The Remote Eye Kit connects directly to your Sky receiver via your standard aerial cable. This will enable you to use your Sky remote and control your Sky receiver from another location.

The Remote Eye Kit enables you to control all the normal functions on the "Sky" receiver, such as TV Guide, Channel Up/Down and interactive services (The RED Button). It can also be used to control "Sky +" and "Sky HD" receivers, which means you can record, pause live TV and playback any programmes that are stored on your the Sky planner.

To install your Remote Eye Kit you will need to run a length of coax cable from the socket marked RF2 on the back of your Sky receiver directly to your Aquavision. Simply plug the cable into one side of the Remote Eye and then plug the Remote Eye into the AQUAVISION® aerial socket. You then need to connect the jack plug (shown below left) into one of the two "IR INPUT" sockets (shown below right) on the back of your Aquavision®. Your Sky box may then need to be set up to facilitate this. Please refer to your Sky user guide on how to do this.
